

Data Integration Suite

Data Integration Suite

Data Integration Suite is a modular business solution that provides managed access to business information, maximizing the value of this information through:

- Centralized data repository management.
- Leading edge of system integration.
- Direct access to Business Information.
- Query and reporting functions.
- Reusable components and interoperability, allowing adaptation to continuous business changes.
- Photos, signatures, fingerprints and documents capture.
- Web-based information access tools.

Components:

GUI Designer

A graphical user interface designer of customized data views, data collection screens, and data exchange processes. Data objects include: data fields, labels, expressions, calculator fields, pick lists, and memos. Using the unique properties of each object, the user can create the GUI Logic and customize data collection and exchange screens. Objects can be selected for view-only or edit functions, and the specific user interface can be assigned to specific users. The GUI Designer's easy to use interface minimizes training requirements and increases productivity.

Database Engine

Database Engine combines a user friendly, object oriented environment with the functions and tools needed to configure, create, and manage data. The system is based on an open architecture and can reside on any major relational database. The user can access multiple databases, call queries and reports, manipulate and store data. Links can also be established to access external database sources within the organization. Connectivity to external sources can be established through ODBC or links to flat files. Security is managed by providing password-protected accounts with expiration dates. Users can be assigned specific functions, as well as specific and unique data entry screens. The system creates audit trails of who, when, and what modifications were made to the system. Archiving functions are provided to maintain historical information, thus eliminating the need to maintain unwanted data in the current database.

Imaging Manager

Imaging manager enables users to view, capture, store and export images including: photos, signatures, fingerprints, and documents. Images can be captured or scanned using Twain compatible devices, or imported from image files. Supported image formats include GIF, JPG, BMP, TIFF, and CMP. Image manipulation functions such as zooming, enhancements, annotation, cropping, and exporting can be used to further enhance image management. Multiple images can be linked to individual records in the database.

Web Portal

Web portal provides the ability to access information, via the internet or the company's intranet, to browser-based users. This allows fast and direct access to business information.
