

Law Enforcement Solutions

*Identification and Security Solutions for Enhancing security,
Integrating data and Reducing costs*

GetData's law enforcement solutions are designed with the flexibility to conform to your Identification and Security specifications. Our integration technologies enhance the functionality of your existing database information by integrating your facility's existing information databases with our identification and security systems.

Wristband Systems

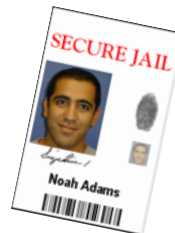

One-step printing of standard ID information and Photos with Barcodes or RFID Encoding with inmate data. Data is detected through both portal readers and scanners, facilitating contact-free identification and tracking, while helping to prevent erroneous releases.

In addition, the Wristband System can be used to update and store inmate information, streamline account data, and debit inmates' commissary accounts each time a purchase is made.

InmateTrack

InmateTrack is an Inmate Management System, allowing law enforcement agencies to efficiently capture, store and manage digital images, demographic, arrest and charges data and identify and verify inmates for arrest and release.

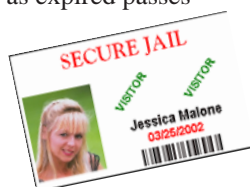

ID MANAGEMENT SYSTEM

A complete photo ID system allowing you to issue ID cards to personnel, visitors and inmates.

Visitor Control System

The system provides total control of visitor access. Administrators can adjust limits and predefined passes as needs change. Reports of who, when and where visitors have been, as well as expired passes can be viewed and printed.

Clincher wristbands

Clincher Wristbands, for identifying and classifying, are made of high strength material, tamper evident and specially designed to meet the needs of law enforcement.
